

Animals in Winter - UK

Some animals can conserve their energy during the winter. They go to sleep for a long time when it is cold and food is more difficult to find.

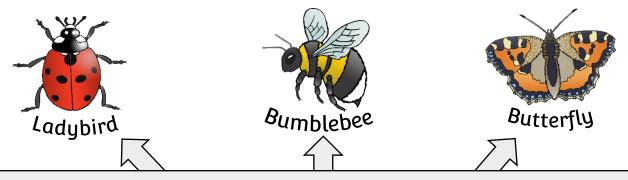

In warm-blooded animals this is called HIBERNATION.

(A long, deep, sleep)

In cold-blooded animals this is called **BRUMATION**.

(A long sleep, but they may get up and move on warmer days)

In insects this is called DIAPAUSE.

(A slow state that insects enter when it is too cold or there is little food)
